

COORDINATED AV BLOCKADE – EMERGENCY MANAGEMENT DASHBOARD

Synthetic Concentric City | Agent-Based Model + Queuing Theory Overlay | 2026-05-23 08:17 MST

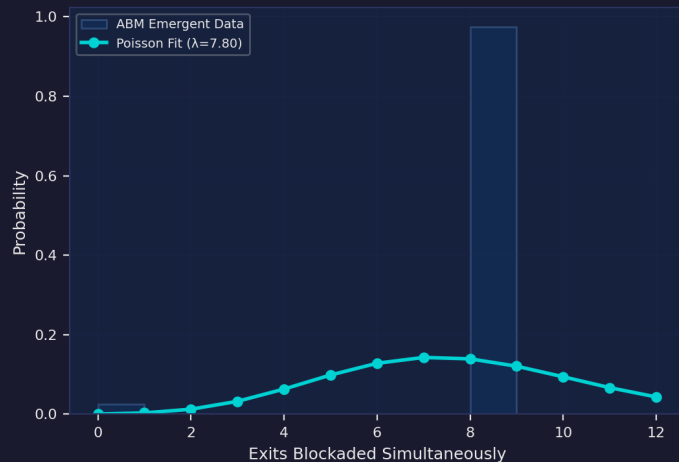

Emergent Blockage Over Time

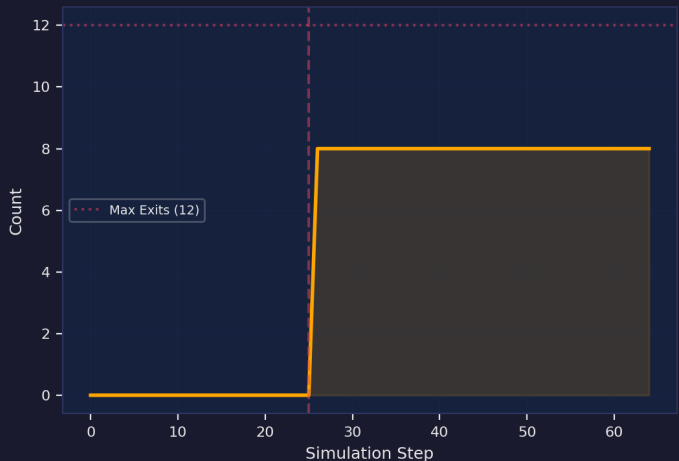

City Grid – Final State

Poisson Fit — Exit Blockade Rate

Exits Blocked Over Time

SYNTHESIS & RISK ASSESSMENT

I. ABM EMERGENT OUTCOMES

Vehicles Blocked: 57 / 800
Grid Paralysis: 7.1%
Exits Blocked: 8 / 12 (67%)
Attack Trigger: Step 25

II. MATHEMATICAL FITTING

Model: Poisson (Queuing Theory)
Arrival Rate (λ): 7.80 exits/step
 $P(\text{Total Gridlock})$: 4.34% steady-state

III. SOP MITIGATION RECOMMENDATIONS

ELIMINATE: Update AV protocols to reject synchronized stop commands near critical infrastructure unless multi-source validated.

MINIMIZE: Deploy decentralized community protocols (FCRM) to coordinate resilient neighborhood logistics via alternate routes.

DETECT: Real-time anomaly detection on fleet-wide velocity telemetry to flag coordinated deceleration patterns.
